

Cut Your Long Distance Bill by 40%

Do you have remote offices? Did you know that inter-office calling typically represents 25-40% of a company's total long distance bill? With MultiVOIP® Voice over IP gateways, you can eliminate these recurring long distance charges by bridging your existing voice network to your data network.

Here's How it Works:

- MultiVOIP routes inter-office calling over the data network instead of the PSTN
- Interfaces with any existing telephone system
- Transparent to the user
- Typical payback for a one-time investment is 3-12 months

Immediate Cost Savings

Many companies have invested thousands of dollars on both their voice and data networks. MultiVOIP protects that investment by tying both systems together. The voice traffic essentially "rides for free" on top of the data network, using the network infrastructure and hardware already in place.

Easy to Use

Placing calls with MultiVOIP is like using your existing phone system. It simply plugs into your data network and will interface with any phone system to provide real-time, toll-quality voice connections to every office on the VOIP network.
